

Processes & Threads

We structure complex systems as sets of simpler activities, each represented as a **sequential process**. Processes can overlap or be concurrent, so as to reflect the concurrency inherent in the physical world, or to offload time-consuming tasks, or to manage communications or other devices.

Designing concurrent software can be complex and error prone. A rigorous engineering approach is essential.

Concept of a process as a sequence of actions.

Model processes as finite state machines.

Program processes as threads in Java.

Concepts: processes - units of sequential execution.

Models: **finite state processes (FSP)**
to model processes as sequences of actions.
labelled transition systems (LTS)
to analyse, display and animate behavior.

Practice: Java threads

Models are described using state machines, known as Labelled Transition Systems **LTS**. These are described textually as finite state processes (**FSP**) and displayed and analysed by the **L TSA** analysis tool.

- ◆ **LTS** - graphical form
- ◆ **FSP** - algebraic form

modeling processes

A process is the execution of a sequential program. It is modeled as a finite state machine which transits from state to state by executing a sequence of atomic actions.

a light switch
LTS

$on \rightarrow off \rightarrow on \rightarrow off \rightarrow on \rightarrow off \rightarrow \dots$ a sequence of actions or *trace*

FSP - action prefix

If x is an action and P a process then $(x \rightarrow P)$ describes a process that initially engages in the action x and then behaves exactly as described by P .

ONESHOT = (once \rightarrow STOP).

ONESHOT state machine

(terminating process)

Convention: actions begin with lowercase letters
PROCESSES begin with uppercase letters

FSP - action prefix & recursion

Repetitive behaviour uses recursion:

SWITCH = OFF,
OFF = (on \rightarrow ON),
ON = (off \rightarrow OFF).

Substituting to get a more succinct definition:

SWITCH = OFF,
OFF = (on \rightarrow (off \rightarrow OFF)).

And again:

SWITCH = (on \rightarrow off \rightarrow SWITCH).

animation using LTSA

The *LTSA* animator can be used to produce a trace.

Ticked actions are eligible for selection.

In the LTS, the last action is highlighted in red.

FSP - action prefix

FSP model of a traffic light :

```
TRAFFICLIGHT = (red->orange->green->orange  
-> TRAFFICLIGHT).
```

LTS generated using *L TSA*:

Trace:

```
red->orange->green->orange->red->orange->green ...
```

FSP - choice

If x and y are actions then $(x \rightarrow P \mid y \rightarrow Q)$ describes a process which initially engages in either of the actions x or y . After the first action has occurred, the subsequent behavior is described by P if the first action was x and Q if the first action was y .

Who or what makes the choice?

Is there a difference between input and output actions?

FSP - choice

FSP model of a drinks machine :

```
DRINKS = (red->coffee->DRINKS  
| blue->tea->DRINKS  
).
```

LTS generated using *L TSA*:

Possible traces?

Non-deterministic choice

Process $(x \rightarrow P \mid x \rightarrow Q)$ describes a process which engages in x and then behaves as either P or Q .

```
COIN = (toss->HEADS | toss->TAILS),  
HEADS = (heads->COIN),  
TAILS = (tails->COIN).
```

Tossing a coin.

Possible traces?

Modeling failure

How do we model an unreliable communication channel which accepts **in** actions and if a failure occurs produces no output, otherwise performs an **out** action?

Use non-determinism...

```

CHAN = (in->CHAN
| in->out->CHAN
).
  
```

FSP - indexed processes and actions

Single slot buffer that inputs a value in the range 0 to 3 and then outputs that value:

```

BUFF = (in[i:0..3]->out[i]-> BUFF).
  
```

equivalent to

```

BUFF = (in[0]->out[0]->BUFF
| in[1]->out[1]->BUFF
| in[2]->out[2]->BUFF
| in[3]->out[3]->BUFF
).
  
```

or using a **process parameter** with default value:

```

BUFF(N=3) = (in[i:0..N]->out[i]-> BUFF).
  
```

FSP - constant & range declaration

index expressions to model calculation:

```

const N = 1
range T = 0..N
range R = 0..2*N
  
```

```

SUM      = (in[a:T][b:T]->TOTAL[a+b]),
TOTAL[s:R] = (out[s]->SUM).
  
```

FSP - guarded actions

The choice (**when** $B \ x \rightarrow P \mid y \rightarrow Q$) means that when the guard B is true then the actions x and y are both eligible to be chosen, otherwise if B is false then the action x cannot be chosen.

```

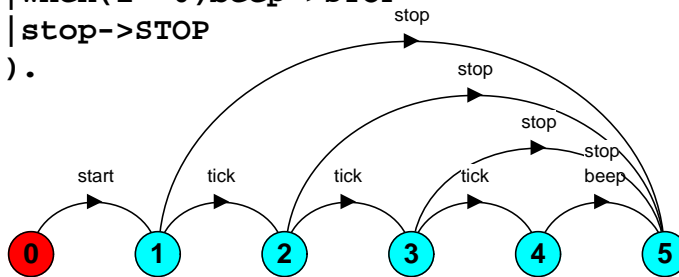

COUNT (N=3)      = COUNT[0],
COUNT[i:0..N] = (when(i<N) inc->COUNT[i+1]
| when(i>0) dec->COUNT[i-1]
).
  
```

FSP - guarded actions

A countdown timer which beeps after N ticks, or can be stopped.

```
COUNTDOWN (N=3) = (start->COUNTDOWN[N]),
COUNTDOWN[i:0..N] =
  (when(i>0) tick->COUNTDOWN[i-1]
  |when(i==0)beep->STOP
  |stop->STOP
  ).
```

FSP - guarded actions

What is the following FSP process equivalent to?

```
const False = 0
P = (when (False) doanything->P).
```

Answer:

STOP

FSP - process alphabets

The alphabet of a process is the set of actions in which it can engage.

Alphabet extension can be used to extend the **implicit** alphabet of a process:

```
WRITER = (write[1]->write[3]->WRITER)
        +{write[0..3]}.
```

Alphabet of WRITER is the set {write[0..3]}

(we make use of alphabet extensions in later chapters)

2.2 Implementing processes

Modeling **processes** as finite state machines using FSP/LTS.

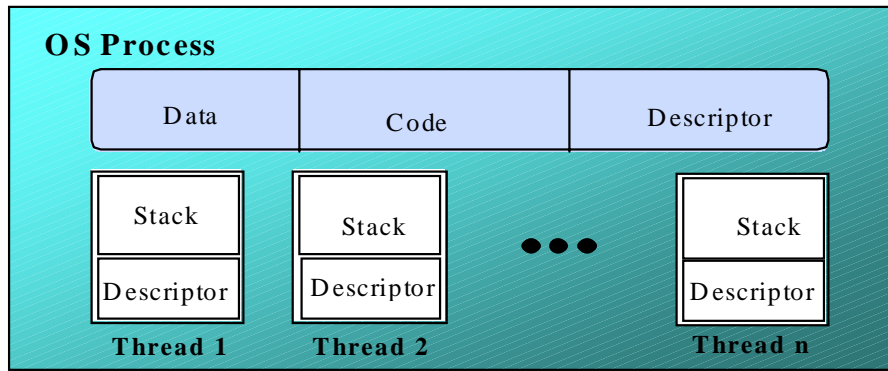

Note: to avoid confusion, we use the term **process** when referring to the models, and **thread** when referring to the implementation in Java.

Concurrency: processes & threads

Implementing processes - the OS view

A (heavyweight) process in an operating system is represented by its code, data and the state of the machine registers, given in a descriptor. In order to support multiple (lightweight) **threads of control**, it has multiple stacks, one for each thread.

Concurrency: processes & threads

threads in Java

A Thread class manages a single sequential thread of control. Threads may be created and deleted dynamically.

The Thread class executes instructions from its method `run()`. The actual code executed depends on the implementation provided for `run()` in a derived class.

```
class MyThread extends Thread {
    public void run() {
        //.....
    }
}
```

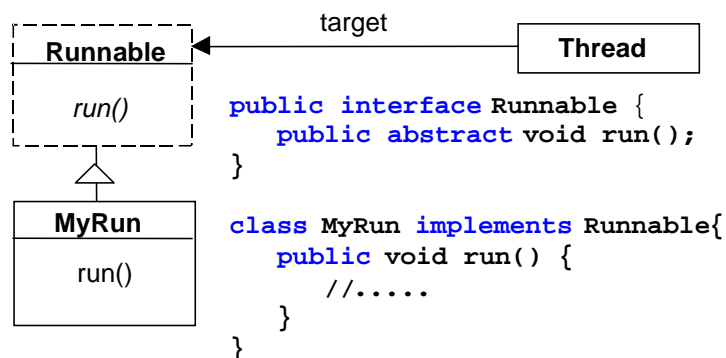

Concurrency: processes & threads

22

©Magee/Kramer

threads in Java

Since Java does not permit multiple inheritance, we often implement the `run()` method in a class not derived from `Thread` but from the interface `Runnable`.

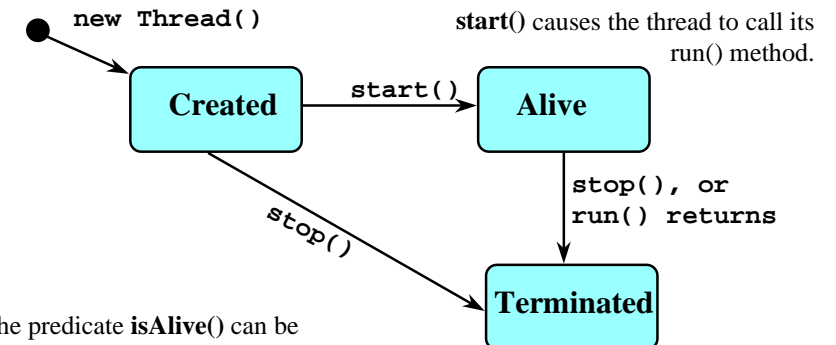

Concurrency: processes & threads

thread life-cycle in Java

An overview of the life-cycle of a thread as state transitions:

The predicate `isAlive()` can be used to test if a thread has been started but not terminated. Once terminated, it cannot be restarted (cf. `mortals`).

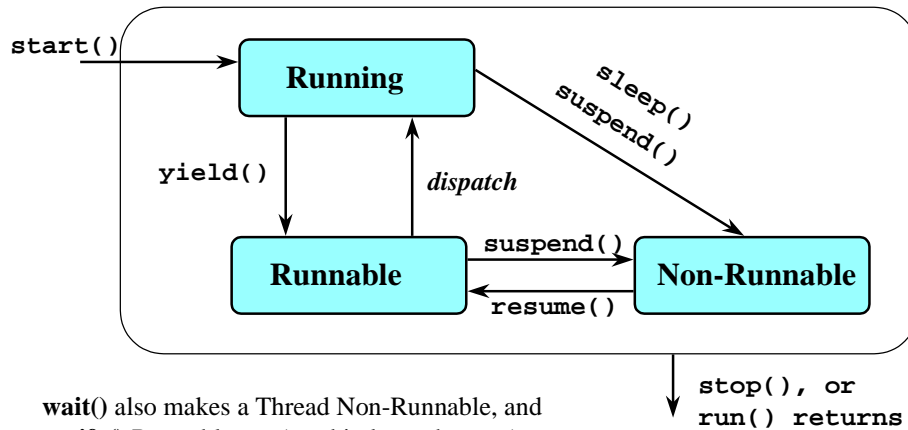

Concurrency: processes & threads

24

thread alive states in Java

Once started, an **alive** thread has a number of substates :

wait() also makes a Thread Non-Runnable, and **notify()** Runnable (used in later chapters).

Concurrency: processes & threads

25

Java thread lifecycle - an FSP specification

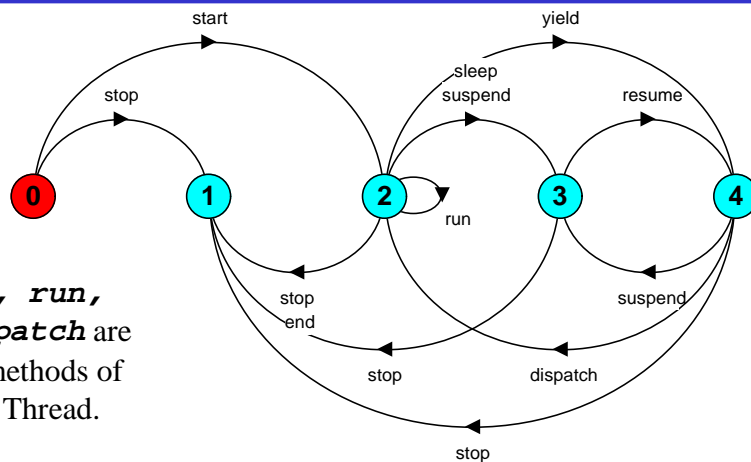

THREAD	=	CREATED ,	
CREATED	=	(start	->RUNNING
		stop	->TERMINATED),
RUNNING	=	({suspend,sleep}	->NON_RUNNABLE
		yield	->RUNNABLE
		{stop,end}	->TERMINATED
		run	->RUNNING),
RUNNABLE	=	(suspend	->NON_RUNNABLE
		dispatch	->RUNNING
		stop	->TERMINATED),
NON_RUNNABLE	=	(resume	->RUNNABLE
		stop	->TERMINATED),
TERMINATED	=	STOP .	

Concurrency: processes & threads

26

©Magee/Kramer

Java thread lifecycle - an FSP specification

end, **run**, **dispatch** are not methods of class Thread.

States 0 to 4 correspond to **CREATED**, **TERMINATED**, **RUNNING**, **NON-RUNNABLE**, and **RUNNABLE** respectively.

Concurrency: processes & threads

27

CountDown timer example

```

COUNTDOWN (N=3) = (start->COUNTDOWN[N]),
COUNTDOWN[i:0..N] =
  (when(i>0) tick->COUNTDOWN[i-1]
  |when(i==0)beep->STOP
  |stop->STOP
  ).
  
```

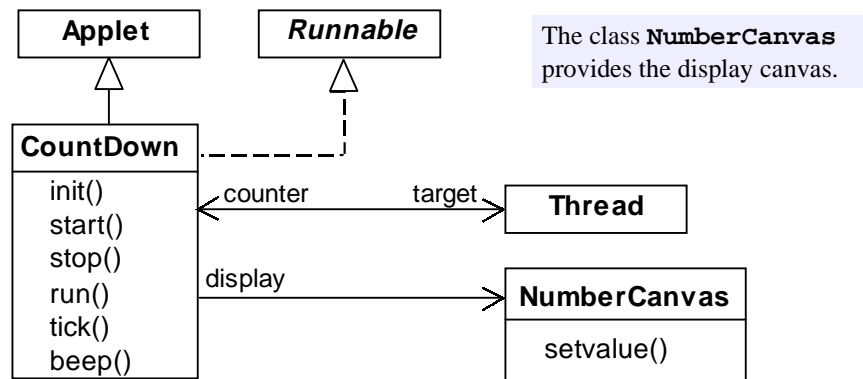

Implementation in Java?

CountDown timer - class diagram

The class **CountDown** derives from **Applet** and contains the implementation of the **run()** method which is required by **Thread**.

CountDown class

```

public class Countdown extends Applet
    implements Runnable {
    Thread counter; int i;
    final static int N = 10;
    AudioClip beepSound, tickSound;
    NumberCanvas display;

    public void init() {...}
    public void start() {...}
    public void stop() {...}
    public void run() {...}
    private void tick() {...}
    private void beep() {...}
}
    
```

CountDown class - start(), stop() and run()

```

public void start() {
    counter = new Thread(this);
    i = N; counter.start();
}

public void stop() {
    counter = null;
}

public void run() {
    while(true) {
        if (counter == null) return;
        if (i>0) { tick(); --i; }
        if (i==0) { beep(); return;}
    }
}
    
```

COUNTDOWN Model

start ->

stop ->

COUNTDOWN[i] process
 recursion as a while loop
 STOP
 when(i>0) tick -> CD[i-1]
 when(i==0)beep -> STOP

STOP when run() returns

Summary

◆ Concepts

- **process** - unit of concurrency, execution of a program

◆ Models

- **LTS** to model processes as state machines - sequences of atomic actions
- **FSP** to specify processes using prefix "->", choice " | " and recursion.

◆ Practice

- **Java threads** to implement processes.
- **Thread lifecycle** - created, running, runnable, non-runnable, terminated.
